Dragon Answers

Brian Cadejo on saving programs to disc, a mysterious problem with Dream, inspiring information into a running program and diverting TRON to the printer.

Editorial

What an irresistible opportunity — I mopped up practically everything worthy the name of news last month by going round the Desert Show and phoning up half the Dragon world beforehand. Results: three quarters of a page to three around this month.

I've done two things with it: one is to reproduce a 'universal Dragon User' which I hope readers with a suitable opportunity will be able to display on a notepad or in a window. The other is to offer tips a line for news reporting. Don't all fall over at once — it must be new news which we haven't had from primary sources, but think about it: find two lines of publishable news and you've paid for the stamp ...

The Expert is tied up with exams for about three months, so if anyone else with a genuine addition problem and a bit of know-how fancies themselves as columnist for a month, here's your chance. Send an outline if you don't want to write columns on spec, to me, at Dragonpicks.

If anyone else thinks we owe them a Don Stoker by the end of next week, please write. I'm still having a spot of bother collating files after the move. What I need is a reverse Hoover — one which disgorges things I thought I had dealt with just as I discover I haven't. Now, about those questionnaires ...

How to submit articles

The quality of the material we can publish in Dragon User each month will, to a very great extent, depend on the quality of the submissions that you can make with your Dragon. The Dragon computer was launched on to the market with a powerful version of Basic, but with very poor documentation.

Articles which are submitted to Dragon User for publication should not be more than 5000 words long. All submissions should be typed. Please leave adequate margins and a double space between each line. Programs should, whenever possible, be computer printed on plain white paper and be accompanied by a tape of the program.

We cannot guarantee to return every submitted article or program, so please keep a copy if you want to have your program returned; you must include a stamped addressed envelope.

Letters

This is your chance to air your views — send your tips, compliments and complaints to Letters Page, Dragon User, at 84a Catford Road, Haurville, Middle T9J 4R7.

Old news in demand

It is possible to give a brief summary of the contents of Dragon User for the past three and a half years so that I could order back copies? I am particularly interested in firmware routines that would be exceeding by grateful.

Well, hello, naturally in this office has been close a complete index of Dragon User, for the very good reason that we never have time, but we know it's man who has... Publisher Software have published Magbase for Dragon User, which gives you a complete index of your fingertips, costs under a fiver, and is updated periodically. Perhaps it's time for me to interfere upon the fruits of their good work. Publisher can be contacted at 28 Foshill, High Compton, Stroud, Glos GL2 7HQ.

We will pay for quality

I would like to agree with Ken Smith in the May edition when he wrote that he would be prepared to pay a higher price for some top class American software. I have been enquiring whether there was any body at present buying software from American, and whether it was practical to do so.

Unfortunately, it appears that there is very little being produced in the USA for the CoCo 2, which is the equivalent of our trusty Dragon. The main interest now is in the CoCo3, which has a far larger memory, and is therefore not compatible. I would love to be joined writing on this matter.

It was a still good software I would be interested in forming a collective to identify sources and import the software. Could anyone inform me as to what

Every month we will be shelving out a game or two, courtesy of our supplier, to the reader's who send the most interesting or entertaining letters. So send us your hints and your opinions, send us your hi-uses and suggestions. Send us your best Dragon stories. What d'you think we are, mind readers?

We want articles on how to use software

Many thanks for keeping DU going. A possible idea for a few lines might be to use some of the more complex programs, eg Flex, Dynabook spreadsheet. I find that one has to spend so much time trying to get things running one runs out of available time when a few good worked examples would clear up most of what are really just silly faults.

I am not knowing programs, but it is just that instructions only become clear after you don't need them. Maybe that's how it is with a few tips giving the BASIC programs — there must be some things not covered by the short sheets.

J J Gilling, 935, Johns Road,
Claverdon, Avon, B23 1TG

RARELY have I seen the 'documentation dilemma' stated so succinctly and with such dignity. I am in total agreement, although I will say in defense of people who write computer manuals — not that most of them do it — that users do occasionally come up with some very imaginative questions; you know the kind of thing — how do I use my spreadsheet to write a novel? Willing can I get my newsletter out of the disc drive? And other things which reduce programmers to tears. Serve them right, too.

Bob is buried deep under a heap of paper at the moment, but he may find something to add in due course. Meanwhile, if anybody wants to write a definitive guide to using any of the major packages, please drop me a line and volunteer, stating your software and your experience. This is potentially a very useful angle, and one which DU hasn't touched on for some time.

Is this possible or even legal as a group basis?

Finally, if any of the companies still supporting the Dragon are considering arranging the import of such software, I would like to assure them that I am prepared to pay £100-£150 for good software.

WP at rest

WONDER upon wonder! This morning I receive the long awaited next issue of Dragon User, and what do I see but one

massive article about using the printer port as a controller for external circuitry. Brilliant! Seriously if you keep this up you'll start giving people like me ideas and one day a cheap graphics card may arise.

I can see that what the Dragon has been lacking all along is a good resolution with eight colours or so, and a programmable word generator. It shouldn't be too difficult to interface a graphics processor and a sound processor. For example, the Texas Instruments TMS320C25 HL graphics chip (which isn't incorporated in the TK 8044A, the Emulator and the 8020 machines) comes complete with its own ROM, so that a minimum of interfacing

and external circuitry is required. The good chips which most of the other computers (eg the Oric, Emulator) have are similar to the AY 3-8910 which provides three voices and even with programmable envelopes etc. I'm sure such a chip could be easily interfaced. When I think of the sort of power affordable it, say, the newest 16 graphics processor for instance, chips, I see it reviewed in ETU it would provide graphics resolution capability. However, I am still learning about electronics, as it is a hobby and I'm busy enough without it.

Thanks for clearing up the 'obscure dream' in the letters page. Concerning my word processor, my Dragon is not in the bank, not in the word processor. What I lack is a display! I said my self as I am studying and a TV would completely obliterate my chances of learning anything new to begin research next year. Yes, Pete Gerrard was right about my being male — girls tend to have a 'hyperactive' school, so they're the ones to copy lecture notes from! I hope he will correct me about the delay, in three years' time, maybe.

So until I get hold of a computer video monitor I will have to use a pen.

SUCH education is an example to us all. How do you live without 'Wogan'? Your information was wrong about the 'typewriter' snail, by the way, unless he means 'hand-writing' determining due to constant use of keyboard. Anybody who has received an editorial red ink letter will know what I mean.

Stand up and write

AS a result of placing a letter in Dragon User about my new magazine, Dragon Logic, I've had a grand total of five letters. In fact, one was from a Dragon enthusiast who didn't own a

Dragon. The Dragon world will be in a sorry state if enthusiasts contribute towards magazines but the actual users don't do a thing. You only get out of a magazine what you put into it. I know we may not all have the talents of the Cadops, GOrnys, Gernards, Lees etc of this world, but too many of you Dragon users are content to see your copy of Dragon either arrive every month, without putting an ounce of effort into it. Without input magazines don't get published. Without magazines, we're nothing.

So let's see your letters, and last! I don't just speak for Dragon Lugs. I'm sure many others feel the same.

Donald Morrison

WELL, I bet that shocks a few of you out of your seats! Spiritually, magazines depend on reader feedback.

GM has never been slow to feed back and ask questions. Dragon Logic reports that Inverness Software still supply Dragon games, although they left the Dragon market two years ago. They say at 2 Minerva House, Collins Park, Aldershot, Berks RG7 4QW for enquiries.

64 columns with discs

THOSE of you who have a disc drive connected up to your Dragon will or may have found that Paul Harrison's 64-column screen adaptor (DU December 1987) does not work properly. This is due to the fact that there is a disc drive controller is connected up to the cartridge port, the graphics pages get moved up by 16384 bytes. Therefore page one is situated at 2072 (419200), page two is situated at 4608 (419200) and so on up to page eight. However, all is not lost, because with the aid of a few simple jokes, the program can be made to work perfectly with a disc drive connected.

Gemini Database

I have recently purchased (secondhand) a Dragon 32 and a copy of Gemini Marketing's Database program came with it. However, the previous owner lacked the instruction manual and although I can load the program, I cannot seem to find out how to return to the main menu display after entering records.

Can anyone who has this program help me with the problem? I would be very grateful if they could. Of course, a photocopy of the instructions would be even better and I would pay the postage costs.

I am also looking a 32K expansion pack and a printer if anyone has one for sale (new or secondhand).

Many thanks.

Seikosha shortage

COULD you or any of the Dragon User readers help me? I have a Seikosha CP180 A printer and I need a ribbon

cassette for it. I have looked in all the likely shops in my area and have drawn a blank. If anyone can tell me where I can purchase the above and at which price I would be very grateful.

M. Bradley
11 Langdale Drive
Bacon
Chester
Cheshire CH1 5AF

ANY need of good deals gratefully received. Have you tried Seikosha or their representatives, by any chance? Any decent computer shop ought to be able to tell you where to get in touch. Or try Harry Whitehouse on 0636 706230.

Tandy traps with extra bytes

I read Eric Hall's description of the Tandy disk operating system with interest, but feel that some people may be misled. As I was at first by his description of the 528 bytes in each sector. In fact the apparently arbitrary sequence of 50s, 5Fs, 4Es etc. at the beginning and end of each sector (described by Eric as 'system control bytes') are part of the stand double-density format (SDM System 34 format) most disk controller chips (including the Western Digital 2707 used in the Dragon) expect this sequence and strip it off, passing only the 288 data bytes to the sp. The only time the programmer has to be aware of the extra bytes is when the disc is initially formatted.

And now a question—Does anyone know of sources of Tandy DOS cartridges (new or old, or even just a circuit diagram)?—several of us are trying to copy CoCo 3s from the USA, and need a DOS cartridge to run with them, but are finding that the supplies via Tandy UK have dried up.

Bob Hall

THANKS, by the way, to everybody who has sent in suggestions, and to those

who send in copies of information about the Dragon Professional. Even if I can't comment on each one personally, be assured they are being read and broadly digested.

A current issue once

While looking through some of my old electronics magazines, I happened to glance at the name of the editor of an ancient (March 1982) edition of *Electronics Monthly*. The editor is one Helen R. Armstrong. Would this Miss Armstrong be the same as our favourite editor?

P.D. Smith
University Hall
Birmingham
Pentagon
Canolf
CF2 1TB

DEPENDS who your favourite editor is, does ... Hang on, what do you mean, ancient??

Draws a correct line

IT like to thank Bob and Ian Thomas for their DragonDOS amendments in Starboard (or MicroViking as it appears to have been re-named). However, lines 580 and 5870 were correct as printed. The statement LINE(X,Y), where X is PSET or PPOINT, will draw a line from the last point specified (or centre screen if no point previously specified) to the point (X,Y). This saves having to remember and enter extra data just because in your part).

Another point is that some may find useful is that the Dragon allows single dimension arrays of up to 11 elements (namely 0 to 10) without the array first being dimensioned.

Finally, thanks to whoever is the office sorted out my late February User. It finally arrived well after the March issue. Is this some sort of record?

Richard Payne
71 Gaskill Drive
Mellingborough
Northants
NN16 5JF

No.

News desk

If you have any new products for the Dragon — software or hardware — send us your press release

AS most of the forward news in the Dragon world was reported in the aftermath of the Great Drive (see last month's issue of Dragon User), there isn't a great deal of product news to report this month. Grange Software are continuing to extend their range of disc software (Grange Software, The Girth, Star Fleet, Navy Dory, Averagentry, Great MTY 90P). They usually have an up-to-date sheet with a guide to available formats on it, and sometimes supply unfilled formats to order ... Bernd Neuner of the Siegfried Computer-Gruppe reports having seen an advertisement for Dragon 64s for \$69 at California Digital, 17702 Figueroa St., Carson, California, CA 90048, USA. Write to California Digital for information and postal charges. The Siegfried Computer-Gruppe publish an AS magazine in German and can be contacted care of Bernd at Dins-Emsbacher-Strasse 23, D-44024 Neunkirchen am Brand 1, Bundesrepublik Deutschland.

Why an ad?

Below this column you will see what looks (or should look) very much like an advertisement for Dragon User.

So why are we advertising in our own pages? And what has this to do with you?

Stick 'em up

The answer is very simple. Major press advertising would swallow up DU's entire budget in a couple of bytes, but we have always regarded this advertisement as a few thousand readers, and that is in a few thousand readers. Many community buildings, clubs and colleges have noticeboards or advertising broadsheets where special interest notices can be displayed, sometimes free, sometimes (as in the ubiquitous newspaper's window) for a few pence a week.

We are not demanding that you cut up your Dragon User! Most libraries have photocopies which will make a good copy for 10p. Copy shops are more expensive, at around 16-18 pence a single copy. Or, if you have access to a friend or colleague's copier.

There are other things you can do, as well. Write a letter to your local newspaper or community magazine, or to another computer magazine, general interest magazine, or national newspaper (aiming for the computer club page if there is one), and simply tell them that DU exists, that it is an independent, non-profit-making publication supporting the Dragon and SBCs community, and where people can find us.

Reporters, please

Well, something is true. If you have your hands on any current news which is pertinent to the Dragon, Tandy and SBCs world, send it to the editor marked **NEWSDESK**, and if we use it we will pay you 10p a printed line (or £1 per printed and given a byline).

The news must be reasonably timely, and must not involve any business or private interest of your own or a colleague's. Please include your source where possible. If you draw our attention to current items in other publications, so that we are able to follow the lead and verify it ourselves, we will pay half the fee above. Payment unpublished news only. First come first served by date of postmark; we cannot use material drawn from press releases which we subsequently receive from the manufacturer (unless they arrive after we have published). Replies to readers' letters and non-Dragon-specific product information won't be accepted as news. All copy will be edited as necessary, and the editor's decision is final.

Of course, if you have a product, your group or other Dragon-related activity you want mentioned in your own behalf, we will publish it as usual if you send a press release to the Newsdesk. Copy date is around the 10th of the month every month.

FOR THE DRAGON COMPUTER

DRAGON USER

is the only independent, professionally-produced magazine for Dragon 32 and 64, Tandy Colour Computer and 6809 users in the UK and Europe.

Published monthly, Dragon User carries information features on programming in Basic and machine code, utility and entertainment programs, game and adventure playing, hardware projects, reviews of new software and hardware, answers to technical questions, and a monthly competition.

Dragon User is available by subscription from Dragon Publications, 49 Alexandra Road, Hounslow, Middlesex TW3 4HP. Tel: (01) 570 8335

Expert's Arcade Arena

Write to "The Expert" at Dragon User
48 Alexandra Road, Hove, Sussex,
BN1 1AF.

HELLO and goodbye! I've got to go now, to leave room for the necessary edited highlights of the Chuckie Egg scene designer instructions. See you in October, maybe now. Take it away, ladies!

Chuckie Egg designer

The program consists of three programs, **listings one, two and three**. **Listing one** recodes the original screens to a fixed-length format, upon which the editor can operate, and a second program, **listing two**, is then required to convert the new-format screens back to the original format, when the game is played. The new set of screens is held high in memory, above Chuckie Egg, and was necessary because the original screens were of random lengths making them almost impossible to edit.

To enter the machine code you must, firstly type in the basic loader program. You must then RUN it and use it to enter listings one, two and three (the instructions for doing this are detailed in the initial issue of the program). The loader, **listings one and two**, and the first part of **listing three** can be found in the June 1985 issue of Dragon. **Listing three** continues with the full page of data 30894-32323, and the short passage 32324-32576.

The code should then be committed to tape as follows:

Listing one:
CSAVEFM "1",30894,32323
Listing two:
CSAVEFM "2",32324,32576
Listing three:
CSAVEFM "3",30894,32576

Once you have typed in and recorded these three programs, you can then compile Chuckie Egg+ by typing the commands below:

1) POKEM13,EXEC 40004
2) "Ready your Chuckie Egg original"
3) INCH=OFF,READ:
POKE13,32324+37 NEXT
DATA13,30894,77,126,94,95
4) RUN
5) EXEC32706
6) "Ready your cassette containing listings 1 to 3"
7) CLEAR99,32345

8) CLEAR0M "1"
9) EXEC 7665
10) CLEAR0M "2"
11) CLEAR0M "3"
12a) CSAVEFM "CH-EGG+"
32324,32324,32576
b) CSAVEFM "CH-EGG+"
32324,32324,32576
13) CLEAR99,32345
EXEC 76493

In the above steps, **listing three** contains the commands for saving and provided snippet 13, the second of which will produce an automatic saving (which can be deactivated by typing CLEAR99 before loading). Both versions should be loaded using CLEAR0M and the ordinary version is executed by typing EXEC.

Instructions

Upon execution the available screen will be displayed and the time will be played. There are then three extra options: 1) Enter the screen editor (not available if the current set of screens has been "locked"). 2) Turn the title time on/off (no noticeable immediate response). 3) Load a complete set of screens from cassette. Upon entering the screen editor, the first screen will be displayed, and the cursor will flash in the centre of the screen. The cursor can be moved around the screen using the arrow keys. The other functions are as follows: **BREAK** Moves to the next screen. **CLEAR** Erase the screen editor. **ENTER** Saves screen to cassette facilities and is followed by:

- 1) Save single screen only
- 2) Save current set of screens, unlocked
- 3) Save current set of screens, locked. Looking at screens keeps out unauthorized eyes, as they cannot be viewed or edited.
- 4) Load single or set of screens. If a loading error occurs, the editor will return control to the main program.
- Any other key returns C
- Clear all the blocks in the game playing area. T
- Turn the screen lock on/off. When the screen is on, the current character will not be cursor as it is moved by the cursor keys.
- Repeat key D. Draw all the blocked and the farmer. These will be removed as the cursor passes over them, but

their positions will remain in memory. S Draw only the chickens which will appear on the screen at the start of each game. Increase the number of initial chickens on the screen. I Decrease the number of initial chickens on the screen. R Restore key. The screen as displayed is only in temporary storage and is permanently stored when **Break**. Clear or Enter is pressed. To erase the screen layout in temporary storage and restore the last permanent screen, press the R key. Chickens are not displayed on the screen layout because they are larger than the other elements of the game, and they can be placed on top of other elements. The elements of the game can be placed on the screen by pressing the appropriate keys, but they must be placed according to the rules of screen design. Some of these rules are checked for all the keys are pressed (immediately) when are checked for when the user attempts to leave the screen — by pressing **Break**, **Clear** or **Enter**. If these conditions are not met, you will not be able to leave the screen.

Mad ducks

To place a wall onto the screen, press the "W" key. This will press the "S" key for a seed grain, and the spacebar for a spade. These elements can be placed anywhere in the game area (the game area includes the top three screen lines, the area taken up by the mad duck and the ploughs

upon which the farmer begins). All screens must contain at least one seed grain, but so more than one.

Ladders must always be placed as pairs of ladder blocks, since ladders are twice as wide as other elements. To place a ladder block press the "L" key. Ladders laid right cannot be placed at the extreme left edge of the screen, as these positions cannot be accessed by the farmer (because of his far turn — **Expert**). Ladders cannot be placed on the bottom row of the screen as chickens would descend them and leave the program. Where a ladder intersects (or connects with) a wall, press the "I" key to place an interception block. For the interception to be available, the ladder must protrude by two levels in height above the wall, and the computer will check for this. Each screen must contain at least one ladder.

To place an egg onto the screen layout, press the "E" key. Each screen must contain **twelve** eggs.

The farmer always begins at the bottom of the screen, just left of centre. This position cannot be changed and the wall underneath the farmer cannot be removed.

To place a lift on the screen, press the "T" key when the cursor is on the left-hand side of the required lift shaft position (the lift shaft is two blocks wide — although the original author always used a width of four blocks in order to make the game more difficult). A lift shaft is indicated by an "L" symbol in

SCREEN SHOT OF CHUCKIE EGG EDITOR

the bottom left-hand corner of the start and this block should be replaced by another element of the game to remove the lift. Placing a lift on the screen removes any other elements in its path, and the lift cannot be placed at the edges of the screen or intersect at thermal ducts to respect the farmer's starting position. Only one lift operated on each screen.

Each screen contains five chickens, but not all of them start on the screen at the beginning of each game (the

number can be changed, see above). Chickens can fly to the side and two blocks high. To move a chicken to another location on the screen, press the number 1-8 referring to the chicken you wish to replace when the cursor is in the top-left-hand corner of the space where the chicken would take up. The positions of the chickens are stored in memory separately from the rest of the screen contents, so the ducks can be placed on top of other elements, without removing them and the

chickens are only drawn temporarily. They are also not affected by the RESET/CRC keys. The program creates if the ducks cannot move, so they must have a wall under either foot, or chickens overlapping with their top half (that is why the chicken on level three appears to be flying).

Forbidding the 2828 series of data means most of a day's task for anyone. Paul Burgin says he can supply a cassette containing listings are to those for £2.50, payable to Paul

Burgin, 26 Moorcroft Road, Sheffield S10 4DS (UK only please). Come on, lift it, and take into Burgin regular quantities of food about another lift and an extra crop of whatever... Have fun!

(On its goodbye from him, and it's goodbye from me, goodbye).

The Expert will be back later in the year if anyone wants to contribute his deeper thoughts on the finer points of exotic games to the magazine, write to the Editor.

Crossword

Please get your answers in to Dragon User Crossword Department by the end of the month on the front cover.

The eighth Dragon Crossword emerges from the bottom of a tea chest, a little crumpled but none the worse — oh, my mistake, that's the editor! The sixth Dragon Crossword is spoken in stilted Basic by G. Wagon of Durbles, who would like "Paracetamol Aspirate One, as there's no point in asking for anything less than the best, is there?" and her Adresser of Cherley Wood, who would like "anything I haven't got yet, as long as it's good". The phrase is "MAGG LAMOLAMOR".

There will be a couple of free tapes from the Editor's Magic Batteries Box for the first correct entries out of the hat each month. You can't be telling as which tapes you'd like — you never know, we may have them.

And you don't have to cut up your Dragon User — entries on a photostat or a plain piece of paper will do.

1. Side by side — I step out a fine oddity enough (10)
2. No mice on me, with nothing on — about an alien satellite (7,4)
3. Alone again — play with long sax and a bass (8)
- 4 and 5. Puzzle about the celebrity from Indonesia? (12,3,4,4)
6. A moored oddity by Mexican Peter (5)
7. Driven as hard as intruders (8)
8. Batteries wear chambers leading to a terrible tale? (12,4)
9. What the Union soldiers called the Confederates (6,5)
10. There's a tiger caged at German POW camp (6)
11. Keep a villain into a trap with trial (7,4)
12. Get not rank confused, and boldly went where no man, etc (5,4)
13. Reminded on TV? — His letters lie all around him (10)

by Terry and Derek Probyn

All this month's answers are names of Dragon software. When the crossword is complete, the column marked with an arrow will spell out a phrase.

By no means just your average Zap

Program: Lucifer's Kingdom
Supplier: Orange Software
Price: £5.99 cassette

THE picture on the cassette box is just like the title of this game—very misleading, as it shows the horned head of a demon. At first glance, this appears to be another space-type shoot-em-up game (and is even described as such on the cassette itself) but this is very far from the whole truth. Although my two sons (and even myself when I first played it) loved it as a pure zap-em-up game, this should be played more like a graphic adventure game. By that I mean that you have to plan out your actions and not just necessarily shoot at the baddies.

—There are other objects which can be shot, and greater scores can be achieved by destroying some of these things. The most important of these are the crystals which are placed under characters on the screen and gradually appear as the characters are shot away. They can then be collected by flying over them and a certain number are needed before you can progress from one region of six planets to the next.

One thing you cannot do, however, is to forget about the baddies in your quest for

crystals, as these are a variety of types of these which come up in a variety of ways and also fire at you differently. My pet hate are the ones that descend straight down the screen until they reach your level, and then come horizontally across at you, forcing you to retreat or maneuver further up the screen—if you can! Others circle you in a random fashion, firing at you as they move around. Also if you are not quick enough to destroy one wave of baddies, then the next bunch seems down upon you and they may or may not be the same type. The colour of assailants and the number of them appears to be random, and also seems to have been generated in a way different from the usual poor Dragon randomiser.

If your ship is destroyed, then you start from that point and are not returned to the beginning, which I personally prefer. However, though, if you have managed past the last of the baddies which you were fighting when you were destroyed, as you will then be attacked by the same type again at the restart. Incidentally, you get five lives and I have not yet discovered a way of getting more, although you appear to have unlimited health and ammunition.

Only the very middle of the screen is used in this game, and so much of the screen is used for the score, etc. The movement is very smooth indeed, as is the scrolling and the speed-up poke has not been used to get the increase in momentum, just good programming. I was amazed at the response to the joystick in this game. Why isn't every game like this? Some of the baddies come at you down the very edge of the screen and these cannot be shot, no matter how far over you steer your ship. At the end of each planet, which is not very long in the early stages, the game is paused while you receive your bonus points, and normally I do not like pauses in the middle of games, but believe me you need one.

I would not surprise me if this game caused some controversy in the manner of *The Force* about bugs, as at times it appears that you have shot straight at the enemy without harming it, but this is caused by parts of the terrain which can be shot over and over again, amassing points, but which reverse as you hit them: the first time you can fire through them at the enemy, but not when they have turned round. Also there is a slight problem in the fire button on

the left joystick, which is the one that you use in this game, will fail to work when the right joystick is connected to its own port. At times there is so much happening on the screen that you may not notice some of the enemy bullets which come in at all directions.

Also some bullets appear to be directed out of nowhere, and not really from the baddies. You'll see what I mean when you play it. Another thing which throws me is that it says Player 1 (Indesapable) handles one of the screen with your score alongside it, and as yet I have been unable to access a two-player game as an afterthought. All in all this is a game which I really enjoy playing, and will also be enjoyed by those of you who like pure zap games. Many people will say that it is too similar to *Utopia*, but I have found that the two games need completely different tactics, and enjoy playing both. I would have liked to have given this program five Dragons, but hesitate to give the maximum to a game I have not yet completed. If the rest of the game reaches the same high standard it is certainly worth five.

Mike Short

Find an enemy in your inventory

Program: Underbelly of Ooth
Supplier: Dragonfire Services
Price: £4.00

THIS is an old adventure originally released by Marston Software around 1985, and now revived by Dragonfire. Loading, as usual from cassette, is very slow and the loading screen is not very inspired.

However, when the adventure is loaded you are treated to what must be one of the best screen presentations of any adventure. The text is set out on an old piece of parchment and scrolls nicely up the screen as inputs are made. The drawback to this is that if you forget your surroundings "OOOH" has to be typed to re-

mind you of the scenery. The instructions state that input can be in sentence form, and it took me quite a while to work this out. As you cannot "do one thing AND do another", instead, the word THEN has to be used between the two actions.

This proves to be very useful as I played it more and more, though you have to be careful with your inputs as you have to add for the computer to go through the two separate actions before you can make another move. Another touch I like very much was the automatic putting of a capital to the first letter of your input and email ones to the others. This generally gave it a very professional appearance and in very

pleasing to the eye. The instructions claim that the words are understood, and I must say that I got less "I don't understand" than usual.

As for the storyline, you play the part of an explorer trapped initially in a cage over a pit somewhere underground, and have to find treasures and then escape. There are some nice touches during the adventure, and nothing too outrageous for you to have to do in order to escape, although you are presented with some tedious situations. As one of the warnings: take careful note of what is at each location. There is an ape-woman at one location, and I returned to this location having completed another task, and no mention was

made of her. However, I did what is expected and to and behold she was there, like a cat-in-the-hat to a certain location, as I have lost my life this way several times. The story has a very outstanding setting and some very subtle problems which can, however, be solved logically. One major drawback is that the trash bag is not deleted, and I have completely lost the game several times and I have to admit that I'm one of those people who rarely saves their positions in an adventure game. (That reminds me—GG.)

Mike Short

Just one step to the real thing

Title: *Larkspur/Midford Is Trapped*

Supplier: John Pene Discovers Software

Price: £10.00

Trapped is the first in a trilogy of adventures with the others presumably hot on its heels (part two out now, *midford story* — Ed.). As your mission as Larkspur in this game is to free yourself from a castle, I suppose the next title will be Larkspur *not* trapped any more but has landed himself in more trouble.

The task — getting out of a castle — is not very original. The back on built-in screen is divided into five sections: top left is a picture of Larkspur himself and the title, which remains throughout.

So free Mr Midford you are told that you will need a

parachute. Carrying top is a view of your locations, although these are limited to certain points and vectors; crawling is often used for several different locations — for instance, while swimming in the lake, despite moving in different directions, you get the same view.

Top right is the inventory — not in *Midford* it says about that apartment that you start off with a hot.

Below these sections is the list of accessible directions, and then the rest of the screen is devoted to location description and your response.

The starting point is a courtyard and you move through rooms such as kitchens, cells, an annex where there is a parachute which is typically out of reach. As per normal

there are objects around such as a shield, radioactive waste and a herring which turns out to be a red one — I'm sure I've seen that somewhere else in an adventure.

Admittedly entries such as ALL etc are allowed, although backspacing is replaced by the clear key, which ignores the typed command.

Other standard adventure features include the maze which in this case is a complex of tunnels, and is as frustrating as normal. One thing that I thought would be frustrating was the fact that when you're fatally located against an autozone of rocks or whatever, you have to load in data from side B of the cassette. However, this is done so quickly that you hardly notice. Anyway, good players can't get killed.

All in all, I'm a bit underwhelmed about this one, as there's nothing here that hasn't been done before. *Midford* is not as apparent as the title would suggest, and what there is is nowhere near as successful as say *The Queen for Liza* or *The Gablewood Incident*. Yet I've a feeling this little chap might grow on you as he progresses through his troubles, because his creators can certainly construct a good program, they just need a spark of real originality to turn it into a real adventure.

Philip Short

Parrot goes down 3-0 to Dragon

Title: *Indoor Football*

Supplier: Computape (also Quickbeam)

Price: £10.00

"This session is mounting" here in the stadium, as the teams prepare, knowing that "at the end of this day" only one will be victorious and leaving in mind that "I only takes a second to score a goal".

Just a few football manager clichés to introduce the setting of this game — the indoor stadium. However, you don't have to wear a sheepskin coat and fluffy jetties because you control your team by the tick of a joystick.

Before you are allowed to kick off, however, you have a few tactics to decide. Firstly, the strength of the game is on the relatively short two minutes to a goal including half time. Then you can decide whether to play the computer or a human opponent. Also, there is a choice to the number of players in the team, from seven to eleven. Unfortunately, the opposition has to have the same number of players!

Having made these decisions, you are thrown straight into the battle of the blue-

versus-reds, each displayed as teams of animated players on a sideways scrolling 30-style pitch very similar to *International Soccer* released several years ago for the Commodore-64. In *Indoor Football* you simply get one of your players and to enjoy joystick control only, but if the opposition has possession of the ball, you have to press your joystick's red button when the ball is near. A warning, however, for certain

strength of the kick is determined by how long you held down the button. The ball will then fly (or trickle) down the pitch to get your super striker on the ball, and to do this you once more press the button. The nearest man to the ball will start to flash, enabling you to nudge him in a goalward direction.

Well, that's the idea. My first attempt, resulted in an interval score of around 10-0 needless

A goal that was so perfect that Peter Beardsley would have given his front teeth for it

to say, I had the nil. Beating a mind around other well-worn clichés that "Football is a game of two halves", I remember the second period only to find that the opposition had lost some of their scoring ability. Full time 10-0.

Several further games against the computer resulted in similar though not quite such bad results. Admittedly, playing on a very slow side of the screen

showed Beating human opposition might, but not as satisfying as trouncing the computer.

Beating human opposition might, but not as satisfying as trouncing the computer.

Finally, it happened. A long pass descended straight to the feet of my attacked (and two defenders and a chip over the keeper. A goal that was so perfect that Peter Beardsley would give his front teeth to score it — if he had any. Perhaps he already has.

Since then, I happen to add, I have scored more goals, several of them from kick-offs, where sometimes it seems incredibly easy to dissect the whole of the opposing team's defence.

My aftermatch report is that the graphics are good, not much to shout about, but functionally simple. The game, though, is in a totally superior league to *Goal! Goal!*, although not as addictive as *Superkick*.

Meanwhile, I'm still trying to beat the computer. I'm getting there, but to finish with the most famous cliché, until that time I'm "as sick as a parrot".

Philip Short

Papa was a rollin' . . . airball?

Title: Roll-ball
Supplier: Precision
Price: \$3.95
An arcade-adventure called Roll-ball you might think could have been called Airtail 2. That is a fair description of this program.

The game is set on a distant planet inhabited by tribes of vicious rubes and peaceful rollaballs who are in grave danger of becoming as numerous as the dodo. You have the three remaining little globes with which to save the species and to do this you guide them along numerical pathways picking up pieces of jigsaw (if you come to the conclusion that balls must have hands after all) which intend to form a logo at the top of the screen. Get all the pieces and you live happily ever after, get jumped on three times by the rubes and you're as dead as a moose (I've used words already and I don't want to be repetitive).

This all sounds pretty much like Airtail 2a for, but there are differences. One and the rubes and spines, shoten ribs, walls and thankfully you can't deflate them. That's what these balls. What there is a speed, these rubes don't hang about, and the pathways consist of more twists and turns and convolutions leading you to maneuver onto an exit disc to progress onto the next screen.

Control is totally by the keyboard, no joystick option and it's quite difficult to get familiar with in such a reflex-oriented program. Up to the left is Q, down to the right is A, up to the right is P and down to the left is L. These directions are necessary because of the 3D style perspective that the game is played in. Additional keys used are the space bar to pick up pieces of the jigsaw, enter to pass, clear to exit the screen when on a disc and finally break which forfeits a life when

you appear to be stuck.

However, if you do retreat to the break key or indeed when over you take a life, you are not just put back on the previous screen but are allowed back to the starting screen which means you have to spin through several screens you've previously laid down together back to where you originally were. The ironic thing about this procedure is that you often lose another life while retreating your footsteps.

The graphics are hi-res black and white without any minute detail — balls, rubes and obstacles don't really need precision artistry, but manage to look impressive by the complexity and path the pathways suggest. There's also nice little fun to introduce the game but one thing that has been missed is a score feature, the only guide being the building up of the jigsaw, and the disappearance at the end.

The more I play this the more I like it, at first it's a little too quick when using the unfamiliar keys. Once this is overcome through the challenge of exploring more and more pathways requiring greater ingenuity and speed drives you on. There are forty-nine pieces of jigsaw to collect, with only three lives, so the odds are a bit stacked against you, although you can exit screens without getting all the pieces, so you can play your tactics and draw your maps in advance of completion.

This game has obviously been influenced by Airtail and is still very well written, but the moral is that when you look like your letter it's hard to follow in the footsteps with your own talents. I'm looking forward to the grandchild, though!

Philip Cote

All the answers, but where do you look?

Title: Everything you always wanted to know about OS-9
Supplier: Author, Jason Shover, Inc., 70 Victoria Road, Parkstone, Rhode 01912-0402
Price: \$19.95
I think I have a late corner to the pains and pleasures of OS-9. I must admit I have been finding a hard going. One possible solution could be Jason Shover's book (everything you always wanted to know about OS-9) but I don't know where to look. Priced at \$19.95 it seems a bit expensive, but it does include a disc containing OS-9 utilities.

It has been an experience in the past that books, films, etc. will take time to really live up to their titles. This book is no exception — regular readers of the American magazine Rainbow will recognize the contents as *Accessible OS-9*, a regular monthly feature in the magazine. The *KSQ* is an acronym for Keep it Simple Stupid. The series was meant to help Randy CoCo users get to grips with what was then a new operating system. Jason's

book is in fact a compilation of these articles reprinted, bound in a plastic clip and with a card-ridge paper cover.

The book's biggest failing is that it is not indexed, as it is necessary to read the whole book through to find out the answer to what might be a relatively simple problem. For what is obviously supposed to be a reference work, this is a really serious fault (Dear Author — hi!). To make matters worse, as with our beloved Dragon User, Rainbow will submit to the occasional printer's error. These errors are usually corrected a few articles later in a serious republication of the series of articles, the errors would have been sorted out. As it is, you could spend hours trying to make one of the projects work, only to find that the information is incorrect and is corrected four or five pages later.

A prime example of this is the part that advises how to run forty tasks drives on a Randy CoCo-9 system (the standard for Randy is 35). We are told that there is a forty sample exercise,

just change the data field of two addresses. Unfortunately, the addresses given are not right, and are corrected three pages later.

One of the more pleasant things about magazine articles is that the writer answers readers' queries. When struggling to learn a new system it is easy to get the impression that only you are having these problems and perhaps it is really beyond you. It is comforting to know that others have problems with the system. Anyone who has read the manual supplied with the original system (i.e. from Dragon Data) will appreciate the way the articles are written. They are in a language that even I can understand (well, almost) and presented in a way that is both well explained and quite readable. The real crime here is that there really is a wealth of information contained in this book, if you are prepared to searching for it, with sections devoted to *Macintosh*, *Paradox* and the use of the C compiler all of which are available to the OS-9

user. However, there is no real continuity and you might find a large gap between one *Macintosh* article and the next.

To summarize, this could be a very useful book, spoiled by the lack of any editing or an index. At \$19.95 it does seem somewhat overpriced. However, the size of the market must be taken into account. Just years ago it would have been edited, indexed and printed by the thousands for half the price. How times change these days. Jason will be lucky to sell a couple of hundred and will probably only just cover his production costs.

You may have noticed that so far I have made little mention of the utilities disc. This is because while I have found no detailed what they do or how to use them. By now you will have guessed that what I really need is OS-9 for absolute beginners.

Ron Smith

Memory and assembly

Pam D'Arcy maps assembler tools into the Dragon's memory

FIGURE 1 MEMORY LAYOUT WHEN ASSEMBLING

00000	System workspace (A) 160000 bytes)
40000	Test screen (B) 160000 bytes)
	Dragon-OS, home disk system workspace (C) 160000 bytes)
80000	Graphics screen pages (default 48 switch on in 4 pages, 8 60000 bytes) (D) 161000 bytes)
A0000	Basic program area (actually starts at 90000) (E)
	Basic program private variables area (appears as required to higher addressed memory) (F)
B0000	System hardware stack (lower as required to lower addressed memory) (G)
B0020	Basic string data stack (length=first value of first CLEAR statement) (H)(default 40000 bytes)
B00FF	Reserved machine code area (length=second value of first CLEAR statement) (I)
	DeluxeOS disk system workspace (J) 160000 bytes)
C0000	Basic interpreter ROM (K)
C0000	Cartridge area (ROM) (L)
H0000	Possibly unused area below end of cartridge software (ROM) (M)
B0000- B00FF	System workspace (N)

YOUR FIGURES

WHEN at this stage a reader has the nerve to admit that he still hasn't managed to assemble anything more than using the assembler software in the machine code articles, one cannot help but feel that he cannot be stupid and something should be done about it! A few other questions have arisen concerning memory, so it seems right to give it another go.

Unmodified Dragons have 65536 individual accessible memory locations—bytes uniquely identified by referring to them as having memory addresses (also postal addresses) 0 through 65535. On a Dragon 32, apart from 256 bytes at addresses 65280-65535, the top half of memory (addresses 32768-65279) can be locked if a read = PEEKed test, rather like removing the piece of plastic from the spine of a cassette to prevent it being overwritten. It is made of material that cannot be overwritten (=ROM, Read Only Memory). Corruptible memory is known as RAM (Random Access Memory). Switching on a Dragon 64 gives an identical memory map to the 32, including the ROM. There is further comment on the 64 at the end of these jottings.

All into memory

I am only really familiar with one assembler (Dragon) so some of the following comments may not be applicable to your software. However, generally, there are two phases: interleaving test (source code) as in the nature of editing a Basic program. There will usually be a SAVE/DISK test facility, and assembly to converting the test (=source code) to machine language (=machine code=object code). There may be a save binary code facility built in to your assembler or, if using an assembler like Dream, you cut the program and save it like any other piece of machine/binary code (SAVE/DISK or equivalent command).

To achieve an assembly one needs to be able to fit into memory the assembler program and its workspace, the source code (=test), and the resulting machine code (=object/binary code).

The assembler workspace will include what is known as a symbol table or list that is created while the source code is being converted to object code. The symbol list contains all the names that appear in the label column of the test and the memory address/value that the assembler has worked out (=assigned) for it that are subsequently used in the resulting object code.

All these components of assembling need to be in separate areas of memory—if they start spilling into each other, corruption will occur, either because the assembler program itself has been over-

written or because overwriting of the symbols table/object code while assembling will give indeterminate results and almost certainly incorrect object code. These areas also need to be kept clear of system workspace, including disc workspace, to avoid catastrophes such as file corruption caused by involuntarily auto-loading drives.

Figure one shows a memory map split into sections referred to by reference. Not down your own figures for your system on the right hand side of the chart. Note that sections (C) and (L) are only present if a disc cartridge is attached and only one of them is then relevant depending on whether the DOS software being used is DeltaDOS (L) or other — DragonDOS, Gamma, SuperDOS all utilizing the same workspace area (C). Both types of system use the same length of workspace (6600 bytes) and addresses of areas proceeding following on from these respectively are suitably adjusted.

The documentation of your assembler should give an indication of where in memory text (source code), object code, and possibly its workspace (including the symbols table) are stored. With some assemblers, the text (source code) is made to appear as a Basic program or source code appears alongside Basic statements. If you are using an assembler written in Basic, it may well be that generated object code is stored in the graphics page's memory or one is asked to issue an appropriate CLEAR statement before commenting (or one may be included within the assembler program itself).

Dragon's reply

The following is with specific reference to Dream and in answer to queries arising from its use in previous articles.

All versions of Dream are machine code programs supplied with documentation that includes a memory map for the variant purchased. If the Dream cartridge is being used, the cartridge is plugged while the machine is switched off and does not act as an alien like a games cartridge. Dream is not activated until the appropriate BASIC has been typed in. Before using the cartridge or loading in a cassette or disc version of Dream, a CLEAR command needs to be typed in to reserve memory for the Dream program itself (if not on cartridge) its workspace and text/symbols table/object code areas. Cassettes and disc versions of the Dream program are loaded into the highest free area of memory that it can be accommodated in (including DeltaDOS workspace for such systems).

I didn't realise that I had been inconsistent in my articles in that some mention after CLEAR 20029000 whereas others are after CLEAR20034600. The amount of memory claimed has nothing to do with the version of Dream being used but is the amount of workspace reserved. I was using round figures and tend to use 20000 (which is 48200 if typing in a memory value in decimal and 445000 (20480) if using hex. I do tend to use hex more often as assembler language based, if

FIGURE 2 AFTER CLEAR20034600

84F37	System hardware stack (H)
84F39	Basic string data (H)
95000	Reserved machine code area (L)
	One DeltaDOS attached? (L)
95000	Basic interpreter (L)

FIGURE 3 DREAM WORKSPACE ANALYSIS

95000	Not used
95001	Object code (grows as required to higher addressed memory)
	Symbols Table (Starts at lowest address and of text area and grows as required to lower addressed memory)
950FF	Text (source code) statements (Starts at address 950FF and grows as required to lower addressed memory)
95C00	Other reserved Dream workspace (always 3200 bytes long)
95E00	Disk/DREAM program
END	
(C) PAN D'ARCY	20000000

must say that I've spent some years ago on a calculator with decimal hex displays was money well spent; they are still readily available at that sort of price — otherwise for hex/decimal conversion you can always type in the hex of 74400 (decimal number) or 544000 on the Dragon keyboard).

To save then, the example CLEAR20034600 immediately after switching on (no disc drive) leaves memory as in Figure two.

An advantage of the Alphacon version is that all the space in section (L) (95000-9FFFF — 12288 bytes) is available for text/symbols table and Dream space. Dream on cassette or disc otherwise depots this available space. Using my DISK/DREAM, the program created at address 95C00, meaning that 95000-95CFF (3200 bytes) are available for text

etc. Dream uses the workspace dynamically — that is, it doesn't affix artificial limits to the size of each of the text/symbols/object categories of memory. Figure three is a diagram of the machine code area (L) when using DISK/DREAM.

Continuing with Dream as the example, on then loading up, type BASIC and reply N to 'text is memory' prompt. Although I am a great advocate of regularly saving source code to cassette/tape, it is very useful to be able to flip in and out of Dream retaining existing source code in memory (N to prompt) rather than to have to reload a saved file afresh each time. On entering Dream for the first time (or after saving N in order to clear old source from memory), you are presented with a blank screen. This is the 'edit source' mode where you type in and edit source code statements (without line numbers). This starts filling the workspace

memory, growing down in memory addressing from the original highest available memory address (BASIC address 32001-32047 in this example). The symbols and object areas only come into play when assembly is requested—that is, when pressing Break/Enter to assemble the source code currently contained in the text area.

Should this workspace become filled, Dream gives the message FULL, allowing you to quit the program and reserve a larger workspace, say, CLEAR200, 240000 returning to Dream with Y for test in memory).

Save the current source text then type break/Enter to assemble the program. As it assembles the source, the symbols table will be compiled growing down in memory addressing from the end of the text area then the generated object (machine) code will enter memory starting at the address +1 of the second value of the last CLEAR statement (eg 32001 if the last CLEAR was CLEAR200) — an exception being if the PUT directive has told the

Dream to put it elsewhere in memory.

Assuming that the code has been assembled to address 32001 and the assembly complete, press break/Enter to return to the source (edit) screen then press break/Enter again to quit Dream. Now the generated machine code can be saved to cassette (cd) (SAVECD filename, 40001 and address, etc address or equivalent command.)

This article is only intended to be a pointer, so as it is already larger than expected, I cannot add any further detail. However, if you start running short of space, progressively reduce the CLEAR200 address figure. If OIM occurs, reduce the number of graphics pages (one can achieve POLEARN by a few judicious POKEs as mentioned in Dragon User from time to time). The 260 in the CLEAR statement could be reduced but I do not recommend reducing it to much below 180. DREAMREAM users have the lovely facility to split the source code into sections that can be called from disc for assembling a program whose source code is larger than

could otherwise be accommodated on a Dragon32. Without DREAMREAM, it is up to the user to arrange source code into separately assembled, linkable modules.

The additional RAM can be used with Dream, I have never enquired as to whether Dream is relocatable and suspect that it is as far as load address is concerned but it probably uses 32K mode ROM calls so cannot be used in 64K mode. As I use discs, which do not use 64K mode, just the technique shown in Dragon Answer from time to time where RAM memory is mapped in, copying the contents of the 32K Basic ROM and cartridge (Dragon DOS addresses) onto the identical addresses in RAM. This still leaves 32000-40000 (200K bytes) free for PUTting object code into, leaving more lower memory space for source code text. I write programs in relocatable (position independent) code so that they can run unchanged at a lower address and by using the 32K mode Basic ROM routines have Dragon32 and Dragon4 (32K mode) compatibility.

Winners and Losers

Every month,
Gordon Lee will
look at some prize programming

Hi the mail this month comes a letter from Jim Finlay of Renford.

"I'm knocking on for 47 and had never touched a computer twelve months ago. My son then gave me a Dragon 32 he was discarding (mine on you, Finlay at it, with a couple of text books and some games to play. I soon wanted to do more than play games and started on a text book and rapidly got bored because its instructions seemed to lead only to trial and error, and it had errors anyway. I simply didn't have guidance on how to do the things I wanted to do. Turned to the official Dragon manual left me even more confused.

"Another textbook seemed a speeded thing; it gave a series of modules, explaining how they worked. There was only one thing wrong with them—they didn't work! Even I managed to spot some of the bugs but had finally to give up on the things. It was at this stage that I found that there was a magazine called Dragon User and promptly became a subscriber.

Jim then makes some complimentary remarks about the magazine and goes on to say that he has learned more about programming from DU than from any other source. This has enabled him to put his programming to the test. His first attempt was the November puzzle — probably the most tricky puzzle set in recent months. However, with enthusiasm undimmed, Jim has since tackled the more recent problems and says that he looks forward to future challenges.

"The difficulty of learning programming (or anything else — ditto) from books alone has been a constant feature of readers' letters asking for advice, and I have given hints and tips in past issues. Clearly, the ability to program even simple routines with confidence is an advantage, not only

in regard of the competition, but for other applications for which commercial software is not available. Listings from books are all very well, provided that they do the task you require, and that they are themselves bug-free.

Books on programming I would recommend to the beginner are:

Easy programming for the Dragon 32 and Further Programming for the Dragon 32 both by Ian Stewart and Robin Jones (Pitman Publishing), and Programming the Dragon 32 by Peter Lafferty (Newnes Microcomputer Books).

The first two of these, which are best used as a pair, explain and enlarge upon most of the commands outlined in the manual. Each is illustrated with a short routine showing the command in action, most of the listings being under a dozen clearly printed program lines. Unfortunately, these may now be out of print and only be available second hand.

However, if there is time to choose just one book (with which to be stationed on a desert island) then my choice would be Peter Lafferty's book. This provides a broad outline of Dragon Basic, and is obviously written by someone well versed in the little idiosyncrasies of the Dragon (and which frequently trip up unsuspecting competitors to the competition questions).

On the subject of programming generally, the important thing is to be thoroughly familiar with each of the commands, and exactly what each one does, and the result obtained. Once understood in isolation, the effect of combining these commands to build program lines, and from there routines, can be readily appreciated. To give an analogy if a physicist

understands the effect of altering the shutter speed on the camera, and the effect of adjusting the aperture, he can combine the two to give him the result that he requires.

Of course, what no book can tell you is how to translate the task to be performed into the program. This is just a matter of experience in which the Basic commands form a 'toolkit', and it is up to the programmer to select the right tools for the job. The knack of 'seeing' how a problem can be adapted into a programming task is the important bridge between problem and program. The simpler the routine, the clearer the effect becomes. For example, can you devise a short routine which will exchange the values held in two variables? In other words, given two variables X and Y, place the current value of X in Y and Y in X. (These variables are assumed to hold a different value.) If you are unable to see the solution at once you will probably end up with the same value in both variables, the second value having been lost. However, if the same problem is presented graphically with everyday objects, the solution becomes glaringly obvious: suppose I have a red glass containing white wine, and a white glass containing red wine. The task is to switch the wine so that the colour matches the glass. Clearly a third glass (variable) is needed to save the contents of one of the glasses while the switch is being made. Call this variable Z, and the routine becomes:

```
Z=X: X=Y: Y=Z
```

Little need be said this month about the January competition, which, judging by the number of entries, provided little difficulty. The only 'catch' is likely to be the 'ghost' characters formed by STAB command (see The Answer, Dragon User April 1988, p. 27).

Data grows on trees

Jonathan Cartwright spells out data storage on the Dragon 32

2190 IF A$="Y" OR A$="y" THEN GOTO 2010
2200 RETURN
2300 REM DISPLAY TREE

```

The main topic I intend to investigate is that of trees. Trees normally mean oak, pine and Christmas, but in computing a tree is a way of storing data. Basic, as such, cannot handle trees, although Pascal can. So what is the use of thinking about it? Well, it's a useful technique that can be "fudged" through Basic, and in any case it won't hurt you to know the theory behind data storage.

If you would care to cast your eyes over **figure one**, you should get the gist of what a binary tree is. Basically, it is a very efficient way of storing and searching data. When the numbers are put in the tree, they are organised so that:

- 1) Numbers greater than that in the current node are put to the right hand side.
- 2) Numbers lower than that in the current node are put to the left hand side.

If this is a little confusing, then take a look at **figure two**.

Now we come to the important idea of search through the tree. Because all the values higher than that of the parent node are to the right, and all the values lower than the parent node are to the left, then we can instantly rule out a large chunk of values. If, using the example in **figure two** we are searching for the value 50, then we can instantly rule out all the values less than 50, as all those to the left. We can continue doing this at every node until we either find the number or decide that it is not in the tree at all. This is a distinct advantage over normal searching procedures, where we would go through every value until we either ran out of values or found the value that we were looking for. Using the tree on small amounts of data you will not notice any great increases in speed when searching. However, when I originally wrote this program on a mainframe, I was able to enter vast amounts of data. When searching such large amounts of data, you will notice a great improvement.

At this point it would seem appropriate to give you a program of some sort. Listing one is that program.

The program simulates a binary tree in Basic. It will allow you to enter up to 100 numbers into the tree, and subsequently search it. I have "grown" the tree as a two-dimensional array TREE(100,3). The 100 is the amount of numbers that you can put

```

3010 FOR N=1 TO 5
3020 FOR V=1 TO 3
3030 PRINT TREE(N,V);
3040 NEXT V
3050 PRINT
3060 NEXT N
3070 RETURN
4000 REM END
4010 END

```

Figure one

Figure two

The number 13 is to be added to the tree. As it is greater than the parent node 12, we know that it must go in the right-hand side. The next node on the right is 14. Our value, 13, is less than this, so it must go to the left. There is no node to the left, and so we create one with our value of 13.

List of numbers in tree

12 The first value is always the parent node

9	18	8	10
10	22	9	11
11	2	10	11

The pointers refer to the element number

Figure four

The number 13 is to be added to the tree. As it is greater than the parent node 12, we know that it must go in the right-hand side. The next node on the right is 14. Our value, 13, is less than this, so it must go to the left. There is no node to the left, and so we create one with our value of 13.

in the tree. The 3 takes a little more explanation. The first value is the number itself. The second is the less-than pointer and the third is the greater-than pointer. "So what have these three pointers to do with anything?" I hear you cry. Well, you know that values less than the current value go to the left in the tree, but the Dragon doesn't. You must tell it, and this is what the pointer is for.

The pointer tells the Dragon that the next value less than the current one is in a particular place in the array. The greater-than

pointer works in the same way. Again this may be confusing, so for all those completely stampeded by pointers refer to **Figure three**.

You now know how to search a binary tree, so how do you create one to begin with? This is very similar to searching. The only difference is that if the required value isn't in the tree then you tag it onto the end, taking into account whether it should go to the left or right. **Figure four** is prescribed for those in trouble.

Now you can type in the program listing

Figure five

Figure seven shows this, along with *abc*. This is getting more complex. Before we try to write a piece of software, I'm going to drop you in at the deep end and add the word *abbaa*. This can be seen in figure eight. It may look as though *abbaa* is a valid word while *abba* is not. This problem can be avoided by having a 'terminator' in *abbaa* to signify that the word can end here or clearly on. In addition to this we also need a 'special terminator' to signify that the word *MUST* end here. Look at figure nine for an example. Now you can see that things are much more clear.

You may or may not have noticed that using this system of storage you can 'load' the dictionary into thinking that a word exists when it doesn't. For example, looking at figure nine you could be forgiven for thinking that the word *abbaa* exists. This is one of the drawbacks with this kind of data storage. However, when using real-worlds it does not present too much of a problem.

This system allows you to store more words than you would normally be able to do in ROM.

All that remains is for me to reveal how I'm going to 'bridge' this tiny tree. I can best explain that by a demonstration. Let's take the word DADA. I'm sure you can now imagine how this is going to look as a tree, but for those with a limited imagination I have included it in figure ten. Also in this tree-drawing are three pages. It is using these 'pages' that I presently use. On the first page you will see that there is a number (zero-ordinates) DAs and As are our first two letters, so that explains the location. The 1 means that D followed by A is allowed in a word. The second page has a 1 at (A,T). Again this means that A followed by T is allowed. On the third page we have a three at (T,A).

The three means that this is the end of the word. It is one of our 'special terminators'. So, to recap, in our dictionary we

are allowed D followed by A followed by T followed by A to end. This spells the word DADA. Now we could add all the other thousands of words in the dictionary. I fear, however, that our beloved editor might frown upon the idea as she doubtless wants something else in this month's issue. (At this precise moment, dear people, one issue of *Oregon Journal of Art* Cartwright's words would be the answer to my prayer! However you (the readers) might not be too happy about that and, in effect, we wouldn't win the drawing. So onwards...).

And now for the lastings! Yes, that 72 line listing entitled *listing two* is my special checker! And you all thought it would be a six page job, didn't you? Well, this shows

you how efficient data storage can show your programs and NOT your lifespan. You can enter words into the 'dictionary' and subsequently search for them.

At the moment, the program allows words of up to twenty letters in length, although this can be altered, memory permitting. If the word that you're looking for isn't there then you are given the option of adding it. You might like to try to get the program to load in your word processed files and let you know which words are not spell correctly. I've not done that because a) it is too easy to have it go the time and b) I wrote the routine for *Electronic Author* then all of you with *Starwriter* will tell me for neglecting you.

The Dragon on Prestel

Ken Smith introduces BT's Prestel database

THE day I bought a modem, I was filled with visions of being able to pull information in from all over the globe, chatting to other computer users and looking seats for Dire Straits without standing in the queue. Unfortunately, life is rarely that simple and having solved one problem by acquiring the equipment, I came to the next: who do I ring? After much thought, the most logical step seemed to be to try out Prestel, a huge database, operated by British Telecom.

Now, I would have thought

that since BT operate both Prestel and the telephone system, either the operator or, at least, directory enquiries would have a list of access numbers. That might have been the case if BT really wanted people to use the system. In reality, the only number I managed to get this way was Prestel head office in London, a number which is permanently engaged. Even the demonstration number, given in one of those interior magazines which never mention *Dragon*, proved to be

useless. All this time I knew that all the local access numbers were listed on Prestel but would only be available to me once I had made contact. Eventually I found what I was looking for by logging on to a bulletin board and pleading for help.

Love/hate

That was how my love/hate relationship with Britain's biggest database began. A lot of data has flowed along the bus since then. I have now become

a regular subscriber to the system and have come to know its pains and its pleasures.

Information is displayed in the form of pages on a variable system which allows the use of text and graphics on the same page. Unfortunately, as designers have to be content with a monochrome display since only MODEM gives a high enough resolution. To be sure of using a local number you will need a VDD (VDD/5) modem. VDD (VDD/5) is being phased in

Continued on page 38

Screen Compressor

Jonathan Cartwright squeezes screens into smaller spaces.

HAVING seen screen compressor programs on much larger computers than the Dragon, I decided that it might be a good idea for me too. I'm surprised that it hasn't been done before, as when you've only got 32K to play with, 16K for a full-screen is a large chunk of memory to write out.

Before I start with a program, it might be a good idea to explain how a compressor works. Generally speaking, there's quite a lot of blank space on a graphics screen. Obviously, there is less if your picture is complex. This vast amount of data is very wasteful on memory. For example, you could draw an 8x8 top half of the graphics screen, and it would still take up 64K. What my program does first is to "read" the screen. What it's looking for is a collection of bytes, one after another, which are the same. If it doesn't find such data, then it merely stores the screen byte for byte elsewhere in memory. However, if it DOES find what it is looking for then it can get to work. What it does is store a "runway or repeat" value to signify that the next few bytes relate to compressed data. The run-

ny value it uses is the number 255. After this, it places the value of the bytes which are the same. After that, it places the number of bytes which are the same.

The compressed screen is placed elsewhere in memory so that it can be called up, in its decompressed state. I have made three screens stored at locations 26623 onwards, but you can put it anywhere you like, so long as you CLEAR space and alter the programs accordingly.

The compressor program itself is written in Basic. This is partly for my convenience and also means that the program is easily readable. To use it, first you've typed it in, LOAD up the screen you wish to compress. Then RUN the program. It will, after quite a long time, tell you the start and end addresses of the compressed screen, and with the percentage saving and the length of the screen in bytes. Because I use a C64, I have defined the top of the graphics screen as location 5072, and the bottom +1 as 9010.

Use this program without DOGS attached, subtract 1000 from these values.

Remember to alter the machine code decompressor too.

The test program is a machine code subroutine which does the job of putting the screen back together again. Again it assumes that the compressed screen is at location 26623, but this can be altered to suit your requirements. I have located the routine at 2070, but you can put it anywhere you like. The routine is simply EXECed into action.

If you want to get adventurous then you could store several screens at different locations in memory, and run a "slideshow". This would simply involve changing the store location used in the machine code, before calling up each screen.

The compressor program can make some fantastic savings, although I have sometimes got savings of as little as 4 per cent. My letter-head now takes up nearly half the space it used to, and if I have compressed screens in disc, instead of expanded ones, I can save memory there as well. I hope that this program is of use to people.

Copy to order

Rudy Duyck presents a versatile file-copying program for Dragon Data and Eurohard DOSes.

COPY is a utility to copy any number of files any number of times from one drive to another, and works with all Dragon Data and Eurohard DOSes, including Super-DOS. It is written in Basic with one very short machine code routine (relocatable) used to scroll the screen downwards and stored in the string MCB in line 18, using the data in line 1800. Because of this it is impossible to use the program as it stands with any form of high-resolution text screen. COPY makes its own directory of the source disc and offers you the options of copying all files, a number of selected files, or all files except for a number of selected files. Selection of files is straightforward through the use of a cursor positioned with the up and down arrow keys. The order of copying files can be determined in this way too. I found the information needed to write this program in Grosvenor Software's Dragon-DOS: a Programmer's Guide. If you want to understand how COPY creates its own directory, you will also find interesting information in Paul Dagmar's article *In the Directory in the May 1987 issue of Dragon User*.

The COPY utility will ask you to enter the number (1 or 2) of both the source and the target discs (drives). These must be different; it is unfortunately impossible to copy files from one disc to another using only one drive under Dragon-DOS. After being given this information COPY will access the source disc and create a directory in the array H2B. Only valid files will be included.

When the end of the directory is reached (found by checking for the end of directory flag in line 180) the Dragon generates three MCBs to which you assign your three options: copy all files, select the files you want copied, or select the files you want omitted. Next you are asked whether you want all the files copied to be protected. The default option, also selected if you press ENTER and indicated with a star, is no protection. If you selected the second copy option you will now be able to determine the order in which files are to be copied. With both the second and the third options you get the first screen of the directory and a cursor which you can direct with the up and down arrow keys (which auto-repeat). You select the files by pressing the space bar and you end the selection process and begin the copying with ENTER. Pressing "J" will

erase all the selections you have made so far and enable you to start all over again if you have made a mistake. The screen will scroll up or scroll down as needed.

After the copying is done you are asked whether you want to copy the same files once more, to copy different files from the same disc, to copy files from a different disc, or to stop. If you want to copy from the same disc the program continues by using the directory already in memory. All the copying takes place in one go and COPY will warn you with three BEEP's when it is finished so that you can do something else during the copying (it does not take very long, though). Should any error (except a disk or connection FULL error) occur, the copying ends and you get an error message. If the error occurs because the target disc is full (GF error, code 143) or because the directory is full (FD error, code 148) you will be asked to insert another disc for the other files to be copied onto. The most likely only partially copied file has copied a killed-to-clean up the full target disc.

You can use COPY as a faster alternative to BACKUP (especially in all versions of Dragon-DOS after 1.0: they are slower!) by using a blank formatted disc as target disc and selecting the copy all option. This makes it also possible to backup between different disc formats, if that is what you have the standard Dragon Data disc drive unit with a higher-capacity drive added (in my case a double-sided, 4096-track personal drive) this comes in quite handy! It is also possible to have all files protected in one go.

COPY enables you to re-organise discs by copying files from one clustered up disc to a newly formatted disc in a different order. Even if you choose to copy the files in the same order as on the original disc you should be able to save space because often-used discs are not especially fragile in their state of space. You may wonder why I have not built in an option to sort file names alphabetically. The reason is very simple. I do not see the use of this since quite often a particular software package consists of several programs or include data files and all of these would end up protected all over the disc and the directory if you sorted the files alphabetically. In this way the logical connection between the various components of a package would be lost.

It is easy to merge existing discs onto a blank one using COPY too. A final use for this utility is for people, eg members of a computer club, who want to distribute programs they have written in a number of fellow students, or who want to circulate their translations in disc (as some clubs do). You can do this far more easily and in a less time-consuming manner with COPY because the program allows you to copy the same items time and again.

For those Dragon users who are interested in the way COPY is programmed let me draw attention to a number of features which may provide inspiration for your own programs. The routine in lines 10 to 130 to produce a directory can quite easily be adapted and adapted to your own programs that aim to manipulate disc files, eg to full, restore, or delete programs or masses. The routine in lines 630 to 870 checks for keys being held down without using INKEY\$. The major advantage of this use of the keyboard roll over table in lower memory (300-340) is that the keys auto-repeat. A final remark concerns the error routine in line 1800. Most people seem to believe that error trapping is only useful for preventing wrong user input from interrupting a program. However, error trapping can also be used to advantage in disc operations, eg to prevent writing to the same or full disc (or when aborting the whole program). If you direct the program from an error to a routine that can diagnose the error and take action accordingly you produce a program that offers more user-friendly and that one deal with errors that occur frequently when handling files. In COPY the error routine handles the disc and directory full errors that one must expect to occur when copying from a larger-format disc to a smaller-format disc for instance.

I shall answer any questions in connection with COPY you might have if you include a self-addressed envelope and one International Reply Coupon if you live in the EEC or two if you live outside it. If you do not feel up to the job of typing in the listing, I can send you a disc with the program on it. If you send me 275 Belgian francs by International Money Order (no cheques or postal orders please, the costs deducted by the bank are too high for a small sum paid this way). My address is Rudy Duyck, Nieuwelandweg 8-C, B-8200 Bruges 2 (NL, Antwerp, Belgium).

Write: ADVENTURE

Pete Gernard generates an error message

THERE can be no greater crime for the adventure writer than to release a game that hasn't been fully tested into the unsuspecting public. People who have paid good money for a program have a right to expect that program to be working correctly. A bad game will not make a living, a plumber who doesn't do his plumbing properly will not get paid, and equally so the adventure writer who doesn't care to check a game does not deserve the support of the adventure playing public.

And yet, games released by the largest of companies often contain an unbelievable collection of mistakes. It is not the fault of the company handling the distribution, since they will be paying money in one fashion or another to the company or individual who wrote the game; it is the first place. Under contract, more often than not, and contracts are meant to be legally binding. This little programmer leaves errors unchecked that not only is he treating the public with contempt, if the contract contains some such phraseology as "will deliver a fully debugged, error-free adventure" then he is also breaking the law.

Thus it is of vital importance to have your games checked and playtested before either selling them yourself or submitting them to the company who asked for them. This should preferably be done by someone who knows nothing about the game, and while the initial and final checking should be done by the programmer the all-important middle stages should be handled by someone else. Let me spread an article such as this, for example. I know what it contains, and am therefore likely to miss the odd mistake or two. In other words, I will probably see the world I want to see rather than what is actually written down. I suppose the programmer will almost inevitably play the game as a reluctant (not player), and not go down all those wonderfully obscure paths that make the playing of a competent adventure so enjoyable.

Seized up

With the ever-increasing complexity of adventure games, more obvious paths can lead to mistakes that are often hilarious if caught before the game is released, but a death trap if they are seized upon by a reviewer in one of the popular magazines. Such a reviewer could well be my brother Mike or I, and as one of the games that we produced by working as a team we made some narrative mistakes. All, fortunately, caught before the game was actually released.

It was a two-part adventure based on Homer's epic *The Odyssey*. Mike did the design for the game, and I did the programming, and we tested it between us. This worked quite well, for he didn't know how

the program was put together and I was just following instructions blindly and thus didn't know the correct route to get from problem (a) to problem (b). In order to fit everything into memory I was doing some text compression. This involved changing words and commonly occurring groups of letters, so that one character replaced three or more. Thus "tree" would be represented as "tre", and "by another" and so on. Mike was rather astonished in one early version of the game while he was exploring a king's palace and went somewhere where he shouldn't have immediately he was "surrounded by several large gelfings". Ah, the perils of using two letters mixed up. Wonderful word through gulfins might be, a sort of snail,

haling creature, I would imagine, it would not do for a reviewer to find a gulfum marauding through his copy of the game.

Flags, counters, call them what you will, they play a vital part in any adventure. A flag incorrectly set, or just set at all, not set at all, can produce a minor disaster. In order to escape from the Cyclops' cave in *The Odyssey* our intrepid hero has first of all to blind his ogre and then climb under the belly of a sheep and get out again at the end of the things. The blinded Cyclops only feels the tops of the sheep and fails to find Cyclopses clinging grimly on underneath one of them. When he has successfully escaped he can then tell the sheep to go away, and carry on the game. Also and flag is forgot to set the "sheep-gone away" flag, and so whenever Odysseus went he was followed by a flock of sheep are grazing close by you". He could scale a castle wall, and there would be a flock of sheep on his side. He could swim to his ship, and find a flock of aquatic sheep grazing on the water. That was soon corrected, but not before a subtle hint from Mike had put me

into the problem. It was something like "I see/got/ripped these ***** sheep". Literary talent will out, I always say.

A brick dropped

The role of a playtester is not an easy one, and I always think that they should be highly rewarded if they perform a competent job and successfully eliminate all errors. One of the most common mistakes (by the programmer) seems to be the (silly) that can never be dropped.

[DROPP BRICK

Ohly, you drop the brick.

[BYEMORY

You are carrying a brick.

[DROPP BRICK

Ohly, you drop the brick.

And so on, for ever and ever. A little bug not getting set somewhere. Likewise we have errors that can be continually taken, and are always present in the score description. Conversely, we have objects that are there, and yet you are told they are not there when you try to take them. Again, objects that vanish into limbo when you drop them and which are never seen for the rest of the game. The playtester must attempt everything possible with every object in every location. In an ideal world, and if the game is question doesn't contain a save feature then send it back to the programmer with the politely worded request that you will not test the game until it does.

SAVE and LOAD are two commonly used words that easily lead to errors, and thus I prefer to use SAVE and RESTORE, making sure that the gamer recognizes much more than the first few letters of each word if possible, or have a special condition for the word RESTORE on its own. Players might want to have a rest, not restore a previously saved game. They might want to load a resolver, not load an old file. Once more, the playtester must read these out.

I was fortunate enough on one game to have a nearly efficient playtester. The game had originally been written on one computer by my brother Mike and I, and then I transferred it over to another one. This meant that it needed testing all over again, and so out went, with the inevitable sinking feeling that I might, after all, have overlooked something. Needless to say I had. The game concerned those two indolent characters Holmes and Watson (now out of copyright and open to anyone to write an adventure about, and featured a dog called Toby. On examining Toby you were told that you could see some fleas. Examining the fleas told you that you could see some smaller fleas. Having a bit

more memory left on the second computer than the first one continued the examination of files to a never-ending degree, so that examining the smaller files led you to be told that you could see some that were even smaller. This went on and on, and thank goodness for the competent playtester. He examined more files than I had ever imagined possible, with the end result being that the machine finally ran out of memory and crashed. That was definitely a case of having too many bugs in a game!

Never be tempted to put anything like that into your games, no matter how much memory you might have left, without putting some kind of limit on things beyond which the files will not get any smaller, or whatever. Someone, somewhere, will still feel free and find an error.

When it comes to searching out errors, which after all is what a playtester should be doing, one of the things that is often overlooked is the way that save of a game. Adventure players are a solitary lot, and so that first save have you checked for someone typing in COME? or AGAIN, if you've allowed them to repeat a command? Or HISTORY from MAM when there isn't a previously saved position? A program crash on the first input will not entice anyone to your adventures.

Removing every mistake is, I would imagine, impossible in a highly complex game. You are just not going to be able to

foresee all the possibilities, and that is why you ignore pretending at your peril. A good reviewer will spend many hours on an adventure before writing his or her review, and if they find anything within that time that strikes them as an error, particularly if

it's a crucial one, then believe me that is what the reviewer will concentrate on. I know, I've done it myself! It's always difficult to come up with something new when writing a review, but a critical mistake is a godsend. Don't give anyone the opportunity to lambast your game by leaving in silly errors.

Something that is often overlooked, and again here a playtester is essential, is your spelling and grammar. The most common use of ITS and IT'S (THINK) or THEIR, is irritating. Always have a dictionary by your side when writing or testing a game, and any doubtful words should be consulted straight away. It's (he) always difficult writing about grammar, because someone will pick you up on the inevitable errors, but adventure games should contain themselves with sticking to the simple things and getting them right. By and large a balance between "You are on a road" and a Barmed Lainsynpe 500 word noun description that contains just one sentence.

The simple things are always the best. "You are tramping noisily along a gravel path" is far better than "You are making a lot of noise as you walk along a path with a lot of gravel on it. That's what is making the noise, the gravel, as you walk along it, on the path!" I've seen them, I've seen them, too many! A good playtester will tell you off for writing something like the latter example, and quite right too.

A good playtester is invaluable, and you should never, ever, sell or submit an adventure until it has been tested by at least one person other than yourself. You know how a game should be played, but the great public that control your financial future do not, and they have a right to do so in free games. Test it!

I was going to devote this month's column to some of my story solutions, involving our old friend Professor Doornick exploring a little something called the Pyramids of Doornik an adventure that many people seem stuck on (so is that it)?

Steam up

However, a letter arrived in tandem with an adventure program written by the author of the letter, who signed the adventure reviewed within three scored pages. Perhaps it will be reviewed by someone else, I don't know, but in these days of slowness by Oregon software houses there are certain ways to go about giving a game a reasonable chance of getting reviewed. That an adventure will not be reviewed? The author of this letter has taken the letter

course, and I hope that all you adventure fanatics out there will bear with me for a while as I digress into the world of right and wrong.

If I am asked to review a game of the adventure variety like those at least a partial map and solution. The time involved in exploring a new game is such that, unless the game proves to be particularly wonderful, it's not worth doing. Reviewing an adventure game takes up a lot of time for a day, and without a helping hand you are in the same position as someone who has just bought it all the shell or ordered it through the post. Having said all that, I will stick to a game as long as the accompanying letter is of at least four pages.

A good number of years ago I converted three adventures that I'd written so that they would work on the Oregon. I had little knowledge of the computer, but my

publishers insisted on the conversion as the adventures were accompanying a book. Three listings were given in that book, but the publishers really wanted a tape as well, in case people couldn't be bothered typing in page after page of listings. Fair enough, and I spent a reasonable amount of time getting those three adventures up and running on the Oregon. To send a game in for review that has been recorded over one of my old tapes is not the best way of entrusting yourself to the person who is hopefully going to review the game.

Exclaim disclaimer

The letter that came with this afternoon's tape gave me a brief summary of the plot. Nothing scoring there, but perhaps a great adventure lurked beneath the said

outline. After this summary came the quote (a brief and simple adventure by my standards): "Okay, perhaps the chap is a mile big-headed, but that we all could fall into that particular category at times. I am told that someone else is 'fucked on her early review-copy?' So? I haven't seen the game yet."

The exclamation marks are all in the letter, by the way, they can't move.

I am told that the adventure features a **WISIT** command that gives a list of verbs used by the game. Good idea. Such verbs as "unlock & brief" are quoted, alongside the author's comments "rather more additional?" Integers have been doing it for years, albeit not on a Dragon.

Another quote: "Danger situations exist, prompted by 'What should I do?', and only one response works" if there is anything that I hate in an adventure is games more than anything else it is the instant death situation. It is so pointless. Adventures are meant to be a test of a person's logic and, perhaps, lateral thinking, and to find yourself being killed off for no apparent reason other than that the game's cryptic underhand a particular sentence structure irritates me in the extreme. One response in an instant death situation? Come on, there are better puzzles to be made than that.

I shall quote again: "Two maze areas exist, the mine area and the marsh. Thorne needs mapping as it has loads of blind areas with no exits and all the exits are hidden; these being those I think" I dislike mazes at the best of times, but can see their point in a well-structured adventure and have indeed spent many an enjoyable hour working my way through a particularly difficult maze. However, blind areas, no exits, exits hidden? An easy way of quickly programming a difficult adventure.

Get it write

Finally I get the comment "I hope you'll give it a fair bit of space in D. User, please, all I have not been mentioned for months..." obviously not been reading the review in Dragon User—PG. J.: 2000 Software need a boost as they cannot afford D. User advert rates? You have not been mentioned for months, and you will not be mentioned unless I get a reasonable letter. Give it a fair bit of space! There's nothing better than free advertising, you know who you are, so climb off that pedestal and admit that other people are of interest in the adventure world as well as yourself.

If you go for that matter anyone else could like a game reviewed here, then please send me a brief a partial map and solution, don't demand acres of column space, don't put pointless quotes in it, and above all don't boast.

And why then? I've got all that off my chest, I shall climb down from my pedestal as well and, somewhat out in the face, continue with the Adventure Trail.

Space now forbids a story solution to Pyramids of Doom, so as this is being written in a rush pretty much deadline forward two weeks. Either that or failed to get

last month's copy... leaves space for comment from the little Must Be Obscured... "OK, OK, I apologise! Next time be a dear and put it in an obituary more than two inches apart? Please? You will have nothing less than the full solution, courtesy of the admirable Martin Edwards and Richard Edwards."

Y: Get the pole (a shovel) and GO POOL. Get key (get liquid (in container) and C, N, E: DRS, get the small key. S, DRS again and GO HOLE. Unlock the door then return U: again. Drop the shovel, get the stone. Unlock the main door and go in, then drop both keys and light the flashlight. You are in the Pyramid of Doom.

Z: Open the sarcophagus. Go M, E and get the key. Go M, S, Sand play the flute here. Examine (use) LOOK the fireplace to find a coal (there's old Magic! See! See! play the flute through and use it in Guit of Thieves!). LOOK fireplace (some ash) and examine ashes to find a necklace. Get the NECKLACE. Go passage then go H and E. Read the hieroglyphics (if you can spell them) and drop the stone and the necklace. Get the jelly (what a wonderful thing).

Q: W with N and drop the jelly. The crystal will eat the jelly, dropping a pearl, so you should get the PEARL, go halfway R, drop pearl, W, H, and also you should drop the flute here, too.

A: Go W, R and go sarcophagus. D, clean Herodotus's sword, but don't treasure it! and your water to extinguish burning leaves. Now you can get the TAPETRY. Go above, look box, look box (yes, again) and get the iron claws. Get the skull and remove it. Go to GOLD TEETH.

D, W, H, and drop the skull. W, C, H, H, H, and wear the gloves. You'll probably drop a (heavy) flask, you can pick it up and reveal it. Hit doorway and remove the gloves.

Q: Get the rope and go S, S, go ladder, then N again. Throw rope (up to the ceiling to help you get up there) and throw ruby (to

help kill the pharaoh) then get the GAPPY-HOLE.

T: S and LOOK FURNISH then look at the explorer box. Get the PIN and the CARP. M: then go W and D. Drop the carpet and get the saw.

S: N, U, W, N. Saw table, drop saw and get NECKLACE. E and go archway. Drop the tapestry, teeth, necklaces, pin, carving and sapphires. Go W and H.

W: get saw, S, get key, get key. Go sarcophagus. D, S, go ladder. S, get rope and open the chest. Get the CROWN. Put the chain. Go stairs, saw table, drop saw, wear gloves, unlock coffin, drop both keys. Look coffin and get the BRACELET. Go window, get BAR, go W, D, W, D, N, H, go door, feel floor and get COIN. Go E, light flashlight and get the SCARAB. Go W, W, light the flashlight. S, U, W, N, E, go arch. E, drop sword, coin, bat, crown and bracelet.

W: SCORE.

Adventure mags

And there you have it, traps and chaps, please, the complete solution to an adventure that conjures up some other obscure problems at times, but all should now be revealed in order to enable you to fly away another game as 'completed'.

Finally for this month we have two changes of address (note apart from the sub-headers). I've mentioned before in this column a couple of home-produced adventure magazines known as *Scottrayer* and *Adventure Probe*. Both were set up by the hard-working Angus Sharkey, who deserves much praise for all the effort he put into launching them and getting them onto a regular monthly basis. If you want complete maps and solutions, *Scottrayer* and *Adventure Probe* are the other best, if you prefer the shorter approach with scene links, tips, reviews, stories, a veritable plethora of adventure information, then *Adventure Probe* is the magazine for you. Once upon a time they were both produced in the great metropolis of Wigan (Challenge Cup Winners, well-known local), but recently, owing to a variety of circumstances, they have moved elsewhere. For *Scottrayer*, you will need to contact John Barnsley at 32 Merivale Road, Rising Brook, Salford, Salford, S7 11HAA. I have the first part of that address, thanks to something out of Lord of the Rings, written by that chap whose name I used not to be able to spell. For *Adventure Probe*, your editor is now Marilyn Rodriguez, (please, despite the name), who resides at 24 Mossy Lane, Llandudno, Gwynedd LL30 1UE. A simple enough address when you get used to it! Sample issues are currently available at £1.25 for *Scottrayer* and £1.00 for *Adventure Probe*, if you fancy sampling their wares.

End of space, as usual. To the un-named person who sent the game in for review, don't despair. To that person, and the rest of you, bye for now.

A lifetime in 48 days

How long to make your first million? says Gordon Lee

Prize

Reviewed in last month's *Dragon* (p.9), we now have ten copies of *Super Numb* from Omega Software for the stars of the July competition.

Rules

It isn't what you say, it's how you say it. Say it with your Dragon: print out your working, add any comments you wish to add, put them in an envelope marked **JULY COMPETITION** and send the lot to the usual address which is now (as we remind you, *Dragon* Publications, 40 Alexandra Road, Hounslow, Middlesex TW9 4HP).

And now the fairer side — *Super Numb* is tough! I wouldn't have time to think of a solution. Let's think. Everybody has a favourite number. Or an all-favourite number. Tell us about your favourite (or unfavourite) number. The more the *Dragon* likes.

April winners

Teddy's one, this, However, a fair number of readers had the right answer up their sleeves. The lucky winners are: I.A. Newman of Appleton, S.A. Stoddart of Clevedon, Graham Barber of Sutton Coldfield (the man who has everything except a new printer ribbon), R. Haine of Saffron, Don Robertson of Epsom, Patricia Hill of Cranston, Sleaford, D. Hanley of Cleckheaton, Dave Lennar of Glasgow, Arian Henderson of Bromsgrove and Fred Wilks of Hatfield. Denis M. is spreading his love rumours about the telephones again, but loves by a nose (see, there is a man with a new ribbon).

Some of the telephones were too close to survival for comfort. I observed that the last ones were mostly from non-winners. Can Denis be right after all? But not the any more. The ribbons, but victorious Barber prevails.

"The Editor said, 'They'd like their drink better if it were decolourised.' I thought he said, 'They'd like to think better if they were decolourised.' So I said, 'Off with their heads'."

An understandable mistake! said Alice.

Commendations to everyone who mentioned heads, and everyone who mentioned decolourised (well, the Editor an apple).

The prize this month is a gift bag of their recent releases, *Underbelly's* of Crotch and *Pyramidventure* and discount vouchers from *Dragonair* Services. Selections will be on their way soon.

Solution

See opposite page.

WHEN the British mathematician G.H. Hardy called on the Indian mathematical genius Srinivasa Ramanujan, he is reported to have remarked that the number of his taxi, 1729, was not a very interesting one. "Not at all," replied Ramanujan, "it is the smallest number expressible as the sum of two cubes in two different ways!"

While not suggesting that this is typical of encounters between mathematicians, it does illustrate the fact that some numbers are more interesting than others. But what exactly constitutes an 'interesting' number? Can any number be said to be 'uninteresting'? Of course, a number need not be interesting purely in a mathematical sense. He could well have a personal 'top ten' of favourite interesting numbers — even if they are only the ones he uses to do the football pools.

Amongst the lower numbers it is not difficult to find an association with any given number. For example, the number 18, the biblical night denoting the sixth element, water, the basic element on which life depends. To the historian, that same number might conjure up thoughts of the sixteenth Henry VIII, or even the six King Georges, while the musicologist would think of 'Les Six', a group of French composers with their own distinctive style. The mathematician would undoubtedly note that 18 is the smallest 'perfect' number — that is its whole number divisors (1, 2, and 3) also add up to its own value.

But what about 'uninteresting' numbers? Are there any of those? Let's suppose that we make a list of all numbers, starting at 1 and progressing upwards. On the left-hand side of the page we put all of the 'interesting' numbers. This, in its early stages, would be fairly extensive. Sooner or later we would come to a number which, despite all our attempts to find some interesting aspect about it, we could be unable to do. Suppose that this number is 32,768. We have already placed 32,768 on the left-hand list as being interesting as the precise number of bytes that is to be found in a 32K RAM such as the one on the *Dragon*! However by placing this number on the right-hand list it now becomes 'interesting' as it is the first number to appear on this side. This compels us to declare it more, after all, interesting, so we have to delete it from the right and place it on the left side of the page. This leaves the right-hand list vacant once again — almost uninteresting number is placed there, when it too will need to be transferred. Thus, by this logical (or illogical) process all numbers become interesting — so matter how high you care to go.

Selection of high numbers reminds me of the story, supposedly true, of the American teacher who told his class that it was impossible to count up to one million in a

normal life span. Whereupon the mother of one of his pupils proved him wrong by not only doing it but also producing the result typed out in full. This, presumably, was in number form rather than in words. But even so (allowing for a space between each number) there would be nearly seven million typed characters in the final list, occupying 1000 double-sided sheets of paper. Even at a typing speed of five characters a second, working eight hours a day, and allowing no time for thought, the task would take about 48 days. If you have a couple of reams of printer paper to spare, so could the computer do the job in a fraction of the time!

It would be interesting to speculate the speed the task would be typed out in the form of words — i.e. beginning one, two, three, four, and continuing up to nine hundred and ninety nine thousand, nine hundred and ninety nine one million. A conservative estimate would indicate that this would require 80 million characters — an increase of almost tenfold on the figures given above!

This month's competition is to devise a simple program to convert a number input in digital form into its 'word' equivalent. The routine should be capable of handling numbers of up to nine digits — i.e. in the range 1 to 999,999,999. So if the number input was 123456789, the printed display would read:

ONE HUNDRED AND TWENTY THREE MILLION, FOUR HUNDRED AND FIFTY SIX THOUSAND, SEVEN HUNDRED AND EIGHTY NINE

Users will be judged on compactness and their ability to produce reasonable English phrases for the range of numbers specified.

Finally, the answer to Srinivasa Ramanujan's problem given earlier is 12 cubed, or 10 cubed plus 1 cubed. Both add up to the same total, 1729. Readers who are interested might like to try out the following listing to compute this answer. If the program is left running it will produce a number of other values greater than 1729, that are also the sum of two cubes in two different ways.

```
10 A=3
20 FOR B=1 TO A
30 T=A*A*A+B*B*B
40 FOR C=1 TO A-1
50 IF C=D THEN G0
60 J=T-C*C*C
70 B=Int(J/(A*A*A-B*B*B+1)/3)+1
80 IF B*D=D*B*D THEN
90 PRINT A;"+"B;"="C;"
    + "CUBED" ; "AT C=D"
90 NEXT C
100 NEXT B
110 A=A+1:GOTO 20
```

The Answer

This is Gordon Lee's own solution to the April competition see page 28 for results

ANSWER: The cards are going clockwise from the queen's quest, 9, 3, 4, king, and 5.

Solution: In the listing the values of each of the possible combinations of cards are stored in the array C(3), C(2), and C(1), running clockwise round to C(3) (the Queen's Card 'X' is at C(3)).

The three FOR/NEXT loops list 30x 50 represent cards C(3), C(2), and C(1). Once these have been given values card C(3) can be calculated as we are told that C(1) and C(2) sum to the same total as C(4)

and C(5). Providing that C(4) is in the range 1 to 13 and is not a 6, the computation proceeds. Line 60 calculates the value of C(2) as we know that the queen and 54 high-cards total the same as C(3) and the cards either side of 6. Again this must be in the range 1 to 13. The next step is to test the total of all six cards and reject all values not equalling 52.

The next information tells us there is only one pair of cards so the routine at lines 120 to 180 checks each card against each of the others to count the number of pairs.

We then test to see if there is a nine present in the current values. Note that at line 210 we only reject sets of values in which there is no nine. The information as given does not exclude the possibility that there is a pair of nines.

If this program is run it prints out six sets of different values. However, the final clue states that if you know the value of card 'X' you could find the answer. Only in one case (when 'X' is a four) does this result in a unique answer. For any other value of 'X' there would be more than one possibility.

```
100 DIM C(5)
110 C(4)=32
120 FOR A=1 TO 13:GOTO 130A
130 FOR B=1 TO 13:GOTO 130B
140 FOR C=1 TO 13:GOTO 140C
150 C(4)=C(1)+C(2)+C(3)
160 IF C(4)=1 OR C(4)=13 OR C(4)=9 THEN 320
170 C(3)=C(1)+C(2)+C(4)+1+13+C(1)+1+1
180 IF C(3)=1 OR C(3)=13 THEN 320
190 T=C(1)+C(2)+C(3)+C(4)+C(1)+C(2)+C(3)
200 IF T=52 THEN 320
210 NEXT C
```

```
220 FOR F=1 TO 50:FOR G=1 TO 6
230 IF C(1)=C(2) THEN PAIR=PAIR+1
240 NEXT G
250 IF PAIR=1 THEN 320
260 NINE=0
270 FOR F=1 TO 6
280 IF C(1)=9 THEN NINE=NINE+1
290 NEXT F
300 IF NINE=0 THEN 320
310 PRINT C(1);C(2);C(3);C(4);C(1);C(2);C(3)
320 PRINT:GOTO 100
```

Communication

Write down your problem on the coupon below (state it as brief and logical as possible) together with your name and address and send to: Communication, 49 Alexandra Road, Hove, Sussex BN1 4AH.

Abstract

1000

THE above routine does not work because the function definition should not be a string, but rather normal Indentation Basic. Therefore, you cannot enter a new function while the program is running (as you cannot indent and store it). The only solution is to have a number of separate subroutines to define all your required functions, and call these as necessary.

The routine listed below will do the trick. It echoes screen text to the printer, but only if `TERM` is activated (by checking the flag at location `074`). Also, the hook at `074` is copied and used to call the routine, so it will work with or without `TERM` attached.

From the basic loader program to install the code, and then load the program you want to trace. The assembly language listing of the code is also given for anyone that's interested.

The simplest way of doing this is really a lot of a hassle, but it works. Set up the statement pointer at 1000101 to point to a listing containing the required name and save address, length etc. (This must end with a zero byte), then call the Basic SAVE command to save. The listing below shows how to do this (SAVE's address is 140001, LOAD's is 144430 in Spectrum ROM 1.0). A call to 12000A1 is made after the SAVE to close the file, normally.

You can use a similar technique to simulate the LOAD command from machines on the

Admittedly, that other fine (black, binary etc.) food and wine without pretenses you appear to have a problem with (dreams that I have not come across before). The examples were standard cassette 90 min calls, and so there should be no special pretenses except that I set a very short header length which previously published papers recommended.

Have any of our readers had the same problem and found a cure? If so let me know and I'll publish the solution.

Non-stop DREAMing

After loading a tape straight through the Oursart editor and assembly package, it starts OK but it never shows when to stop. I have tried all the poses given in your replies in previous inquiries, but to no avail. All the poses refer to altering the head; my problem appears to be a loss of 60° motion.

[illegible]

Input on the run?

All the moment I am working on a program which, among other things, contains mathematical functions. However, I cannot find two inputs functions while the program is running. I have tried the following, but it does not work:

THESE RESULTS ARE DISCUSSED IN SECTION 4.
